

Day-14 Understanding TCP/UDP.

Data sharing: Send / Receive.

Hi this is Bugs 1GB.

There is a limited size of data that we can share in network. That is MTU.

MTU - Maximum transmission unit.

→ (1500 bytes)

Hi this is Bugs → Segments

We cannot send 1GB, so we are going to split the data to smaller size of 1500 bytes or lower. This is called splitting segments.

→ When we send this segments order can be disarranged.

this Bugs Hi is → Order mismatch

ent

ung)

match

Window size) (Synchronization number)

500 501 502 503

Hi this is Bugs

1GB - aggregate
(It will join
the segments)

Scenario - 2

Total no. of Boxes = 4.
(Window Size)

Starting no = 500
(Syn no)

↳ signal loss = Data loss

← Req.

502 Box missing.

Source will have a copy so it will send again.

Now both the PC want to send data to each other so it happens using TCP protocol -

TCP

- Transmission Control protocol.
- Layer 4 protocol
- Connection oriented protocol
- Three way handshake
 - * Segment
 - * Seq. no
 - * Ack no.
 - * Window size
 - * 3 way handshake.
- Very slow.

UDP

- User datagram protocol
- Layer 4 protocol
- Connectionless protocol
- No three way handshake
- More fast than TCP
- Used for small data
- Live data transmission
